Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on February 16, 2010 has been entered.

Allowable Subject Matter

2. Claims 1, 7 to 19, 21 and 23 to 25 are allowed.

3. The following is an examiner's statement of reasons for allowance: A graphite-containing heat-resistant cast iron alloy having a defined composition and a matrix based on a ferrite phase in an as-cast state and after heat treatment, and characterized by having intermediate layers, in which W and Si are concentrated, in the boundaries of graphite particles and a matrix, wherein said graphite-containing cast iron alloy comprises 3.5-5.6%Si and 1.2-15% of W on a weight basis, and wherein a ratio (X_i/X_m) of a weight ratio X_i of W in said intermediate layers to a weight ratio X_m of W in said matrix is 5 or more and a ratio (Y_i/Y_m) of a weight ratio Y_i of Si in said intermediate layers to a weight ratio Y_m of Si in said matrix is 1.5 or more, as recited in claims, is not taught or fairly suggested by the art of record.

4. Claims 1, 7 to 19, 21 and 23 to 25 patentably distinguish over previously applied references Japanese patent 61-1576655 ("JP'655") or German Patent DE 2428821

Art Unit: 1793

("DE'821") because properties, utility, composition and matrix phase are different for the following reasons:

JP'655 is directed to a cast iron tool excellent in seizure and wear resistance suitable for tools, e.g. guide shoe or plug, and has a composition containing 0.5 to 40% Ni and 0.5 to 20%Cr and exhibits a matrix based on martensite and/or austenite.

DE'821 is directed to a wear resistant cast iron alloy suitable for construction of machine parts subjected to high frictional stress and has a composition containing 0.4 to 3.2% Ni (optional) and 0.3 to 2.5%Cr and exhibits a microstructure of bainite and/or martensite.

In contrast, claims of present invention recite a heat-resistant cast iron alloy having high oxidation resistance and thermal crack resistance suitable for exhaust equipment members for automobile engines, such as exhaust manifolds, turbocharger housing, catalyst cases, etc., and further recite a composition that excludes Ni and Cr by the limitation "consisting essentially of" due to their detrimental effects described in paragraphs [0085]-[0088] of instant specification, and a matrix based on a ferrite phase in an as-cast state and after heat treatment.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
